

Rejoice_AI: Mastering the Shell with GitHub Copilot CLI

Objective

The objective of this task is to use GitHub Copilot CLI to efficiently generate, understand, and debug complex shell commands directly in the terminal by transforming natural language requests into executable Git commands

Generated Git Command (Copilot Git Agent)

Natural language prompt used: "I committed locally but haven't pushed yet. I want to combine the

last two commits into a single commit with a new message."

Command Generated by GitHub Copilot CLI:

```
git rebase -i HEAD~2
```

This command opens an interactive rebase session for the last two commits, allowing the user to

squash them into a single commit and provide a new commit message.

Screenshot of Interaction

https://drive.google.com/file/d/13tlzzTTP51cjVmkfG_8K2BrjRDBs2bRw/view?usp=sharing

Accuracy Ranking and Justification

Accuracy Rating: 9/10

The AI-generated response accurately addresses the problem by recommending an interactive

rebase to combine the last two local commits. The solution is correct, efficient, and commonly used

in professional Git workflows, though it assumes some familiarity with terminal-based editors
